

Amendments to the Specification:

Please replace paragraph [0029] with the following rewritten paragraph:

A [0029] As best seen in Figures 4 and 5, retention of the telephone T on the shelf 30 can also be enhanced by two generally parallel guide ridges 34, 36 that extend from the underside 40 of shelf 30 along respective opposite edges 35, 37 near the distal end 28 to form a channel defined by said guide ridges 34, 36 and a portion of the underside 40 of the shelf 30 between said guide ridges 34, 36. These ridges 34, 36 are spaced a distance apart from each other sufficient to accommodate the width of the belt clip C in the channel between them when the telephone T is mounted on the shelf 30 of tongue 26 as shown in Figure 4. Therefore, these ridges 34, 36 resist lateral movement of the belt clip C, thus also of telephone T, off the shelf 30. These two parallel ridges 34, 36, which can be molded in a unitary manner on the underside 40 of the shelf 30, also tend to prevent the clip C from pivoting about a point at which the vertex 33 of the clip C contacts distal end 28 of tongue 26, thereby limiting pivotal movement of the telephone T on the shelf 30 as well.
